Reflection principles

- ▶ The basic theory is EA (Elementary Arithmetic) with language $\mathcal{L}_{exp} = \{0, S, +, \cdot, exp, <\}$

- ▶ For each theory T , *elementary presented*, we consider formulas

- ▶ $Prf_T(y, x)$ expressing "y is (codes) a proof of x in T"
- ▶ $\Box_T(x) \equiv \exists y Prf_T(y, x)$

- ▶ Local Reflection for T is the following scheme, $Rfn(T)$,

$$\Box_T(\ulcorner \varphi \urcorner) \rightarrow \varphi$$

for each sentence φ .

- ▶ Uniform Reflection for T is the following scheme, $RFN(T)$,

$$\forall x_1 \dots \forall x_n (\Box_T(\ulcorner \varphi(\dot{x}_1, \dots, \dot{x}_n) \urcorner) \rightarrow \varphi(x_1, \dots, x_n))$$

for each formula $\varphi(x_1, \dots, x_n)$.

Parsons' Theorem (II)

Theorem

Let \mathfrak{A} be a Σ_{n+2} -closed model of $T + \Sigma_{n+1}\text{-IR}$. Then $\mathfrak{A} \models \text{IS}_{n+1}$.

Proof. Let $\varphi(x) \in \Sigma_{n+1}$ such that

$$\mathfrak{A} \models \varphi(0) \wedge \forall x (\varphi(x) \rightarrow \varphi(x+1))$$

Then there exist $a \in \mathfrak{A}$ and $\theta(u) \in \Pi_n$ such that

$$T + \Sigma_{n+1}\text{-IR} \vdash \theta(u) \rightarrow \varphi(0) \wedge \forall x (\varphi(x) \rightarrow \varphi(x+1))$$

and $\mathfrak{A} \models \theta(a)$. Put $\psi(x, u) := \theta(u) \rightarrow \varphi(x)$, Then

$$T + \Sigma_{n+1}\text{-IR} \vdash \psi(0, u) \wedge \forall x (\psi(x, u) \rightarrow \psi(x+1, u))$$

Hence, $T + \Sigma_{n+1}\text{-IR} \vdash \forall x \psi(x, u)$. As a consequence $\mathfrak{A} \models \forall x \psi(x, u)$. In particular, $\mathfrak{A} \models \theta(a) \rightarrow \forall x \varphi(x)$ and it follows that $\mathfrak{A} \models \forall x \varphi(x)$.

Let us fix a countable first order language L .

- ▶ Π will denote a fixed set of L -formulas such that:
 1. It contains all atomic formulas and is closed under subformulas.
 2. We assume that (modulo logical equivalence) Π is closed under **disjunctions** and **conjunctions**, and
 3. (modulo logical equivalence) $\neg\Pi \subseteq \exists\Pi$, (here $\neg\Pi$ is $\{\neg\varphi : \varphi \in \Pi\}$ and $\exists\Pi$ is $\{\exists\vec{x}\varphi(\vec{x}) : \varphi(\vec{x}) \in \Pi\}$).
- ▶ We say that a formula $\alpha(\vec{v}) \rightarrow \beta(\vec{v})$ is a *normal conditional axiom w.r.t.* Π if
 - ▶ $\alpha(\vec{v}) \in \forall\neg\Pi$, and
 - ▶ $\beta(\vec{v}) \in \forall\exists\Pi$.

Let us fix a countable first order language L .

- ▶ Π will denote a fixed set of L –formulas such that:
 1. It contains all atomic formulas and is closed under subformulas.
 2. We assume that (modulo logical equivalence) Π is closed under **disjunctions** and **conjunctions**, and
 3. (modulo logical equivalence) $\neg\Pi \subseteq \exists\Pi$, (here $\neg\Pi$ is $\{\neg\varphi : \varphi \in \Pi\}$ and $\exists\Pi$ is $\{\exists\vec{x}\varphi(\vec{x}) : \varphi(\vec{x}) \in \Pi\}$).

The basic reduction

- ▶ For each set of formulas Π , we introduce the rule E^Π -Rule given by the instances

$$\frac{\theta(\vec{v}, \vec{z}) \rightarrow \alpha(\vec{v})}{\theta(\vec{v}, \vec{z}) \rightarrow \beta(\vec{v})}$$

for each $\alpha(\vec{v}) \rightarrow \beta(\vec{v}) \in E$ and $\theta(\vec{v}, \vec{z}) \in \Pi$.

Lemma

Let T be a theory and E a set of conditional axioms such that

(S1) For every $\alpha(\vec{v}) \rightarrow \beta(\vec{v}) \in E$, $\alpha(\vec{v}) \in \exists\forall\neg\Pi$.

(S2) $T + E^\Pi$ -Rule is $\forall\exists\Pi$ -axiomatizable.

Then $T + E$ is $\forall\neg\Pi$ -conservative over $T + E^\Pi$ -Rule.

The finite case

Theorem

Let F be a set of normal conditional sentences w.r.t. Π .
Then, for every $\forall\exists\Pi$ -axiomatizable theory T it holds that

$$Th_{\forall-\Pi}(T + F) \subseteq [T, F^{\Pi}\text{-Rule}]_m$$

where m is the number of elements of F .

Corollary

Let E be a set of normal conditional sentences w.r.t. Π .
Assume that E is Π -reducible modulo T . Then for every
finite set of sentences $F \subseteq E$ with m elements, it holds that

$$Th_{\forall-\Pi}(T + F) \subseteq [T, E\text{-Rule}]_m.$$

The finite case

Theorem

Let F be a set of normal conditional sentences w.r.t. Π .
Then, for every $\forall\exists\Pi$ -axiomatizable theory T it holds that

$$Th_{\forall-\Pi}(T + F) \subseteq [T, F^{\Pi}\text{-Rule}]_m$$

where m is the number of elements of F .

Corollary

Let E be a set of normal conditional sentences w.r.t. Π .
Assume that E is Π -reducible modulo T . Then for every finite set of sentences $F \subseteq E$ with m elements, it holds that

$$Th_{\forall-\Pi}(T + F) \subseteq [T, E\text{-Rule}]_m.$$
