# Motivation

- ▶ Proof theory
  - ▶ Hilbert's Programme, Foundations of Mathematics, ~ 1920s
  - ▶ Study mathematical proof as formal objects (i.e. strings)

- ▶ Proof theory
  - ▶ Hilbert's Programme, Foundations of Mathematics, ~ 1920s
  - ▶ Study mathematical proof as formal objects (i.e. strings)
- ▶ Proof mining
  - ▶ Extract concrete information from abstract proofs
  - ▶ Example: proof of  $\exists x (x = f(x))$ . Find such  $x$ , a “witness”.

- ▶ Proof theory
  - ▶ Hilbert's Programme, Foundations of Mathematics,  $\sim$  1920s
  - ▶ Study mathematical proof as formal objects (i.e. strings)
- ▶ Proof mining
  - ▶ Extract concrete information from abstract proofs
  - ▶ Example: proof of  $\exists x (x = f(x))$ . Find such  $x$ , a “witness”.
  - ▶ **Theorem.** There are  $x, y \in \mathbb{R} \setminus \mathbb{Q}$  s.t.  $x^y \in \mathbb{Q}$ .  
*Proof.* If  $\sqrt{2}^{\sqrt{2}} \in \mathbb{Q}$ , let  $x = y = \sqrt{2}$  and we are done as  $\sqrt{2} \in \mathbb{R} \setminus \mathbb{Q}$ . Otherwise  $\sqrt{2}^{\sqrt{2}} \in \mathbb{R} \setminus \mathbb{Q}$ , let  $x = \sqrt{2}^{\sqrt{2}}$ ,  $y = \sqrt{2}$  and observe  $x^y = \sqrt{2}^{\sqrt{2} \cdot \sqrt{2}} = \sqrt{2}^2 = 2 \in \mathbb{Q}$ .  $\square$
  - ▶ In general: a finite set of witnesses

  - ▶ In general: a finite set of witnesses, i.e. a finite tree language!

- ▶ Proof mining: cut-elimination
- ▶ Rigid tree languages
- ▶ From proofs to grammars
- ▶ From grammars to proofs

- ▶ *Cut*: formalisation of the use of a lemma

$$\frac{T \vdash A \quad T, A \vdash B}{T \vdash B} \text{ cut}$$

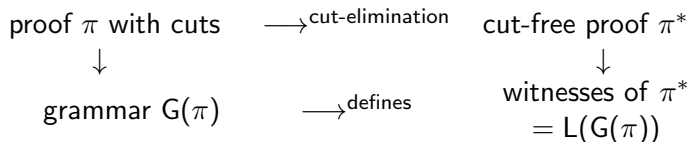

- ▶ *Cut-elimination*: stepwise transformation of proof
- ▶ *Cut-free proof*: possible to read off witnesses
- ▶ *Witnesses for*  $T \vdash \exists x A$ :  $t_1, \dots, t_n$  s.t.  $T \vdash \bigvee_{i=1}^n A[x \setminus t_i]$ .

- ▶ *Cut*: formalisation of the use of a lemma

$$\frac{T \vdash A \quad T, A \vdash B}{T \vdash B} \text{ cut}$$

- ▶ *Cut-elimination*: stepwise transformation of proof
- ▶ *Cut-free proof*: possible to read off witnesses
- ▶ *Witnesses for*  $T \vdash \exists x A$ :  $t_1, \dots, t_n$  s.t.  $T \vdash \bigvee_{i=1}^n A[x \setminus t_i]$ .

- ▶ Basic idea of this talk:

- ✓ Proof mining: cut-elimination
  - ▶ Rigid tree languages
  - ▶ From proofs to grammars
  - ▶ From grammars to proofs

# Tree Automata with Equality Constraints

- ▶ Local equality constraints, e.g.  $f(q_1, q_1) \stackrel{1=2}{\rightarrow} q_2$
- ▶ Global equality constraints via states, e.g. TAGED [Filiot, Talbot, Tison '07]
- ▶ Rigid tree automata [Jacquemard, Clay, Vacher '09]
  - ▶ subclass of TAGED
  - ▶ Rigid tree automaton  $\langle Q, R, F, \Delta \rangle$  where  $R \subseteq Q$
  - ▶ *Rigidity condition* on run  $r : \text{Pos}(t) \rightarrow Q$ :  
 $\forall p_1, p_2 \in \text{Pos}(t)$  with  $r(p_1) = r(p_2) \in R$ :  $t|_{p_1} = t|_{p_2}$ .
  - ▶  $L(\mathcal{A}) =$  all terms which have runs satisfying rigidity condition

# Rigid Tree Grammars

- ▶ Rigid tree grammar  $\langle \alpha, N, R, \Sigma, P \rangle$  where  $R \subseteq N$  rigid
- ▶ *Rigidity condition* on derivation:  
if two productions with  $\beta \in R$  as left hand side are applied at positions  $p_1, p_2$ , then  $t|_{p_1} = t|_{p_2}$ .
- ▶ Example:  $\alpha \rightarrow f(\beta, \beta), \beta \rightarrow g(\gamma), \gamma \rightarrow a \mid g(\gamma)$  with  $R = \{\beta\}$  has  $L = \{f(g^n(a), g^n(a)) \mid n \geq 1\}$ .

# Rigid Tree Grammars

- ▶ Rigid tree grammar  $\langle \alpha, N, R, \Sigma, P \rangle$  where  $R \subseteq N$  rigid
- ▶ *Rigidity condition* on derivation:  
if two productions with  $\beta \in R$  as left hand side are applied at positions  $p_1, p_2$ , then  $t|_{p_1} = t|_{p_2}$ .
- ▶ Example:  $\alpha \rightarrow f(\beta, \beta), \beta \rightarrow g(\gamma), \gamma \rightarrow a \mid g(\gamma)$  with  $R = \{\beta\}$  has  $L = \{f(g^n(a), g^n(a)) \mid n \geq 1\}$ .
- ▶ **Theorem.**  $L$  language of a rigid tree grammar iff  $L$  language of rigid tree automaton.

# Rigid Tree Grammars

- ▶ Rigid tree grammar  $\langle \alpha, N, R, \Sigma, P \rangle$  where  $R \subseteq N$  rigid
- ▶ *Rigidity condition* on derivation:  
if two productions with  $\beta \in R$  as left hand side are applied at positions  $p_1, p_2$ , then  $t|_{p_1} = t|_{p_2}$ .
- ▶ Example:  $\alpha \rightarrow f(\beta, \beta), \beta \rightarrow g(\gamma), \gamma \rightarrow a \mid g(\gamma)$  with  $R = \{\beta\}$  has  $L = \{f(g^n(a), g^n(a)) \mid n \geq 1\}$ .
- ▶ **Theorem.**  $L$  language of a rigid tree grammar iff  $L$  language of rigid tree automaton.
- ▶ **Definition.** A grammar is called *totally rigid* if  $N = R$ .
- ▶ **Definition.** A grammar is called *acyclic* if there is no derivation  $\beta \rightarrow t$  with  $\beta \in V(t)$
- ▶ this paper: totally rigid acyclic tree grammars (!)

- ✓ Proof mining: cut-elimination
- ✓ Rigid tree languages
  - ▶ From proofs to grammars
  - ▶ From grammars to proofs

- ▶ **Definition.** Given a proof  $\pi$ , define a totally rigid acyclic tree grammar  $G(\pi)$ .  
(next slide: example)
- ▶ **Definition.** A proof is called *simple* if every cut-formula contains at most one quantifier.
- ▶ **Theorem.** Let  $\pi$  be a simple proof of  $T \vdash \exists x A$  with  $A$  quantifier-free. Then  $L(G(\pi)) = \{A[x \setminus t_1], \dots, A[x \setminus t_n]\}$  and  $T \vdash \bigvee_{i=1}^n A[x \setminus t_i]$  is provable.  
(in other words:  $L(G(\pi))$  contains the witnesses for  $\exists x A$ )

# Example

$$\frac{\frac{\frac{\frac{\vdash P(a), P(b)}{\vdash \exists x P(x), P(b)} \exists_r}{\vdash \exists x P(x), \exists x P(x)} \exists_r}{\vdash \exists x P(x)} c_r}{\vdash \exists x R(x)} \frac{\frac{\frac{\frac{P(\alpha) \vdash Q(f(\alpha))}{P(\alpha) \vdash \exists x Q(x)} \exists_r}{\frac{P(\alpha), Q(\beta) \vdash R(g(\alpha, \beta))}{P(\alpha), Q(\beta) \vdash \exists x R(x)} \exists_r}{P(\alpha), \exists x Q(x) \vdash \exists x R(x)} \exists_l}{\frac{P(\alpha) \vdash \exists x R(x)}{\exists x P(x) \vdash \exists x R(x)} \exists_l}{\vdash \exists x R(x)} c_l, \text{ cut}$$

$G(\pi) = \langle \varphi, R, \Sigma, P \rangle$  where  $R = \{\varphi, \alpha, \beta\}$  and  
 $P = \{$

# Example

$$\frac{\frac{\frac{\frac{\frac{\vdash P(a), P(b)}{\vdash \exists x P(x), P(b)}{\exists_r}}{\vdash \exists x P(x), \exists x P(x)}{\exists_r}}{\vdash \exists x P(x)}{c_r}}{\vdash \exists x R(x)}}{\frac{\frac{\frac{\frac{\frac{P(\alpha) \vdash Q(f(\alpha))}{P(\alpha) \vdash \exists x Q(x)}{\exists_r}}{\frac{P(\alpha), Q(\beta) \vdash R(g(\alpha, \beta))}{P(\alpha), Q(\beta) \vdash \exists x R(x)}{\exists_r}}{\frac{P(\alpha), \exists x Q(x) \vdash \exists x R(x)}{c_l, \text{cut}}}{P(\alpha) \vdash \exists x R(x)}{\exists_l}}{\exists x P(x) \vdash \exists x R(x)}{\text{cut}}}}{\vdash \exists x R(x)}}$$

$G(\pi) = \langle \varphi, R, \Sigma, P \rangle$  where  $R = \{ \varphi, \alpha, \beta \}$  and  
 $P = \{ \varphi \rightarrow R(g(\alpha, \beta)) \}$

# Example

$$\frac{\frac{\frac{\frac{\vdash P(a), P(b)}{\vdash \exists x P(x), P(b)} \exists_r}{\vdash \exists x P(x), \exists x P(x)} \exists_r}{\vdash \exists x P(x)} c_r}{\vdash \exists x R(x)} \frac{\frac{\frac{\frac{P(\alpha) \vdash Q(f(\alpha))}{P(\alpha) \vdash \exists x Q(x)} \exists_r}{P(\alpha) \vdash \exists x R(x)} \exists_l}{\exists x P(x) \vdash \exists x R(x)} \exists_l}{\vdash \exists x R(x)} c_l, \text{cut}$$

$G(\pi) = \langle \varphi, R, \Sigma, P \rangle$  where  $R = \{\varphi, \alpha, \beta\}$  and  
 $P = \{\varphi \rightarrow R(g(\alpha, \beta)), \beta \rightarrow f(\alpha), \alpha \rightarrow a, \alpha \rightarrow b\}$

# Example

$$\frac{\frac{\frac{\frac{\vdash P(\mathbf{a}), P(\mathbf{b})}{\vdash \exists x P(x)}, P(\mathbf{b})}{\vdash \exists x P(x), \exists x P(x)} \exists_r}{\vdash \exists x P(x)} \exists_r}{\vdash \exists x P(x)} \exists_r}{\vdash \exists x R(x)} \text{cut}$$

$$\frac{\frac{\frac{P(\alpha) \vdash Q(f(\alpha))}{P(\alpha) \vdash \exists x Q(x)} \exists_r}{P(\alpha) \vdash \exists x R(x)} \exists_r}{\exists x P(x) \vdash \exists x R(x)} \text{cut}$$

$$\frac{\frac{\frac{P(\alpha), Q(\beta) \vdash R(g(\alpha, \beta))}{P(\alpha), Q(\beta) \vdash \exists x R(x)} \exists_r}{P(\alpha), \exists x Q(x) \vdash \exists x R(x)} \exists_l}{\vdash \exists x R(x)} \text{cut}$$

$G(\pi) = \langle \varphi, R, \Sigma, P \rangle$  where  $R = \{\varphi, \alpha, \beta\}$  and

$P = \{\varphi \rightarrow R(g(\alpha, \beta)), \beta \rightarrow f(\alpha), \alpha \rightarrow \mathbf{a}, \alpha \rightarrow \mathbf{b}\}$

Hence  $L(G(\pi)) = \{R(g(\mathbf{a}, f(\mathbf{a}))), R(g(\mathbf{b}, f(\mathbf{b})))\}$

- ✓ Proof mining: cut-elimination
- ✓ Rigid tree languages
- ✓ From proofs to grammars
  - ▶ From grammars to proofs

- ▶ Given grammar find proof!  
Caveat:  $L(G)$  is a set of terms,  $L(G(\pi))$  is a set of formulas  
 $\Rightarrow$  Wrap up  $L(G)$  using a new predicate symbol
- ▶ **Theorem.** For every totally rigid acyclic tree grammar  $G = \langle \beta, R, \Sigma, P \rangle$  there is a simple proof  $\pi$  with  $G(\pi) = \langle \alpha, R \cup \{\alpha\}, \Sigma, P \cup \{\alpha \rightarrow Q(\beta)\} \rangle$  s.t. cut-elimination of  $\pi$  computes  $L(G(\pi))$ .
- $\Rightarrow$  Compression power of totally rigid acyclic tree grammars corresponds *exactly* to that of simple proofs.
- $\Rightarrow$  Characterisation of class of proofs by class of grammars.

- ▶ Proofs and tree languages are intimately related

## Applications / Future Work:

- ▶ Proof mining using tree grammars
- ▶ Cut-introduction (LPAR paper)
- ▶ Lower bounds on proofs
- ▶ Operations on languages get proof-theoretic meaning

# Concrete Open Questions

- ▶ Go beyond simple proofs
- ▶ Does there exist a finite set  $T$  of terms s.t. every totally rigid acyclic tree grammar  $G$  with  $L(G) = T$  has  $|G| = |T|$ .  
(Uncompressible term-set  $\Rightarrow$  lower bounds on proof length)
- ▶ What is the complexity of the problem: Given finite set  $T$  of terms, find minimal  $G$  with  $L(G) = T$ ?  
(Cut-introduction)
- ▶ Further cut-introduction algorithms
